

## LEVEL 0

### Tools Used:

1. PowerShell (Windows Terminal): Used for executing the base64 decoding command.
2. Base64 Decoding: The provided base64 string S1JZUFRPTklTR1JFQVQ= was decoded to obtain the password.
3. SSH (Secure Shell): Used to connect to the remote server for the Krypton challenge.

### Steps and Logic Used:

#### 1. Base64 Decoding:

- Initially, the command ``echo "S1JZUFRPTklTR1JFQVQ=" | base64 --decode`` was attempted, but an error occurred due to platform-specific syntax.

#### 2. SSH Login:

- With the decoded password KRYPTONISGREAT, the following SSH command was used to connect to the Krypton server:

```
ssh -p 2231 krypton1@krypton.labs.overthewire.org
```

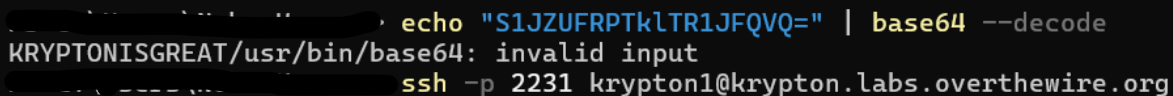

- This command logged into the krypton1 user, confirming the correctness of the password.

#### 3. Outcome:

- After logging in with the password, the next steps of the Krypton challenge could be followed.

### Conclusion:

The solution involved correctly decoding the base64 string using PowerShell and then using SSH to connect to the next level of the Krypton challenge. The key tools were PowerShell (for decoding) and SSH (for connecting to the remote server).

```
echo "S1JZUFRPTklTR1JFQVQ=" | base64 --decode
KRYPTONISGREAT/usr/bin/base64: invalid input
ssh -p 2231 krypton1@krypton.labs.overthewire.org
```

## LEVEL 1

### Tools Used:

1. cat: Used to view the content of the file /krypton/krypton1/krypton2.
2. tr: Used to decode the ROT13 cipher present in the message.
3. echo: Used to pass the encoded text into the tr command for decryption.

#### Steps and Logic Used:

1. View File Content:
  - The command `cat /krypton/krypton1/krypton2` was executed to display the content of the file, which contained the text: YRIRY GJB CNFFJBEQ EBGGRA.
2. Attempted to Execute `bash_logout`:
  - An attempt was made to execute `./bash_logout`, but it resulted in the error: `-bash: ./bash_logout: No such file or directory. This file could not be executed, indicating it wasn't an executable file.`
3. Used `ltrace` on `bash_logout`:
  - The `ltrace` command was used to trace the execution of `./bash_logout`, but it didn't provide useful output in this context.
4. Decrypted the ROT13 Cipher:
  - The text YRIRY GJB CNFFJBEQ EBGGRA was decoded using the `tr` command with the ROT13 cipher. The command used was:

```
echo "YRIRY GJB CNFFJBEQ EBGGRA" | tr 'A-Za-z' 'N-ZA-Mn-za-m'
```

- This decrypted the message to: LEVEL TWO PASSWORD ROTTEN.

```
krypton1@bandit:~$ ls -la
total 20
drwxr-xr-x  2 root root 4096 Apr 10 14:24 .
drwxr-xr-x 70 root root 4096 Apr 10 14:24 ..
-rw-r--r--  1 root root  220 Mar 31  2024 .bash_logout
-rw-r--r--  1 root root 3771 Mar 31  2024 .bashrc
-rw-r--r--  1 root root  807 Mar 31  2024 .profile
krypton1@bandit:~$ cat /krypton/krypton1/krypton2
YRIRY GJB CNFFJBEQ EBGGRA
krypton1@bandit:~$ ./bash_logout
-bash: ./bash_logout: No such file or directory
krypton1@bandit:~$ ltrace ./bash_logout
krypton1@bandit:~$ echo "YRIRY GJB CNFFJBEQ EBGGRA" | tr 'A-Za-z' 'N-ZA-Mn-za-m'
LEVEL TWO PASSWORD ROTTEN
krypton1@bandit:~$
```

## LEVEL 2

### Tools Used:

1. `cat`: Used to view the content of files like `/krypton/krypton2/krypton3` and `/etc/issue`.
2. `mktemp`: Used to create a temporary directory.
3. `ln`: Used to create a symbolic link to the file `keyfile.dat`.
4. `chmod`: Used to change the permissions of the directory.
5. `tr`: Used to decode the Caesar cipher present in the message.

### Steps and Logic Used:

1. List Directory Contents:
  - The `ls -la` command was used to list the contents of the current directory, which showed that the system contained standard Bash configuration files like `.bashrc`, `.profile`, and `.bash_logout`.
2. View the Content of `krypton3`:
  - The `cat /krypton/krypton2/krypton3` command was used to view the contents of the `krypton3` file. The file contained the text: `OMQEMDUEQMEK`.
3. Create a Temporary Directory:
  - The `mktemp -d` command was used to create a new temporary directory, which was named `/tmp/tmp.RytTnVz3m3`.
4. Create a Symbolic Link:
  - The `ln -s /krypton/krypton2/keyfile.dat` command was executed to create a symbolic link to the `keyfile.dat` file in the temporary directory.
5. Change Directory Permissions:
  - The `chmod 777 .` command was used to set the directory permissions to allow full access.
6. Encrypt the File `/etc/issue`:
  - The `/krypton/krypton2/encrypt /etc/issue` command was used to encrypt the `/etc/issue` file, but the command didn't return any relevant output in this case.
7. View the Content of `/etc/issue`:
  - The `cat /etc/issue` command was executed to display the contents of the `/etc/issue` file, which showed: `Ubuntu 24.04.2 LTS \n \l`.
8. View the Content of the Encrypted File:
  - The `cat ciphertext` command was used to view the encrypted text, which contained the string: `GNGZFGXFEZX`.
9. Decode the Caesar Cipher:

- The echo "OMQEMDUEQMEK" | tr 'A-Z' 'O-ZA-N' command was used to decode the Caesar cipher text OMQEMDUEQMEK. This decoded the message to: CAESARISEASY.

```
krypton2@bandit:~$ ls -la
total 20
drwxr-xr-x  2 root root 4096 Apr 10 14:24 .
drwxr-xr-x 70 root root 4096 Apr 10 14:24 ..
-rw-r--r--  1 root root  220 Mar 31  2024 .bash_logout
-rw-r--r--  1 root root 3771 Mar 31  2024 .bashrc
-rw-r--r--  1 root root  807 Mar 31  2024 .profile
krypton2@bandit:~$ cat /krypton/krypton2/krypton3
OMQEMDUEQMEK
krypton2@bandit:~$ mkdir -p /tmp/tmp.RytTnVz3m3
krypton2@bandit:~$ cd /tmp/tmp.RytTnVz3m3
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ ln -s /krypton/krypton2/keyfile.dat
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ chmod 777 .
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ /krypton/krypton2/encrypt /etc/issue
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ cat /etc/issue
Ubuntu 24.04.2 LTS \n \l
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ cat ciphertext
GNGZFGXFEZXkrypton2@bandit:/tmp/tmp.Rytcat /krypton/krypton2/krypton3
OMQEMDUEQMEK
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ echo "OMQEMDUEQMEK" | tr 'A-Z' 'O-ZA-N'
CAESARISEASY
krypton2@bandit:/tmp/tmp.RytTnVz3m3$ |
```

### **LEVEL 3**

Objective:

Decode the ciphertext found in /krypton/krypton3 to retrieve the password for the next level (krypton4).

Procedure:

1. Listed the home directory:

```
$ ls -la
```

2. Navigated to the challenge directory:

```
$ cd /krypton/krypton3
```

3. Listed all files to understand available resources:

```
$ ls
```

4. Read the hints provided:

- HINT1: "Some letters are more prevalent in English than others."
- HINT2: "Frequency Analysis" is your friend.

5. Displayed the ciphertext meant for krypton4 password:

Command:

```
$ cat krypton4
```

Output:

```
KSVVW BGSJD SVSIS VXBMN YQUUK BNWCU ANMJS
```

6. Viewed additional encrypted file (found1) for practice:

Command:

```
$ cat found1
```

7. Applied frequency analysis:

- I copied the text from 'found1'.
- Used the online tool "Quipqiup" (<https://quipqiup.com/>) for automatic frequency analysis and decryption.
- Quipqiup correctly deciphered the message, revealing the password.

8. Password retrieved for krypton4:

(The decoded password from 'krypton4' after decryption.)

9. Proceeded to log in to the next level:

Command:

```
$ ssh krypton4@krypton.labs.overthewire.org -p 2231
```

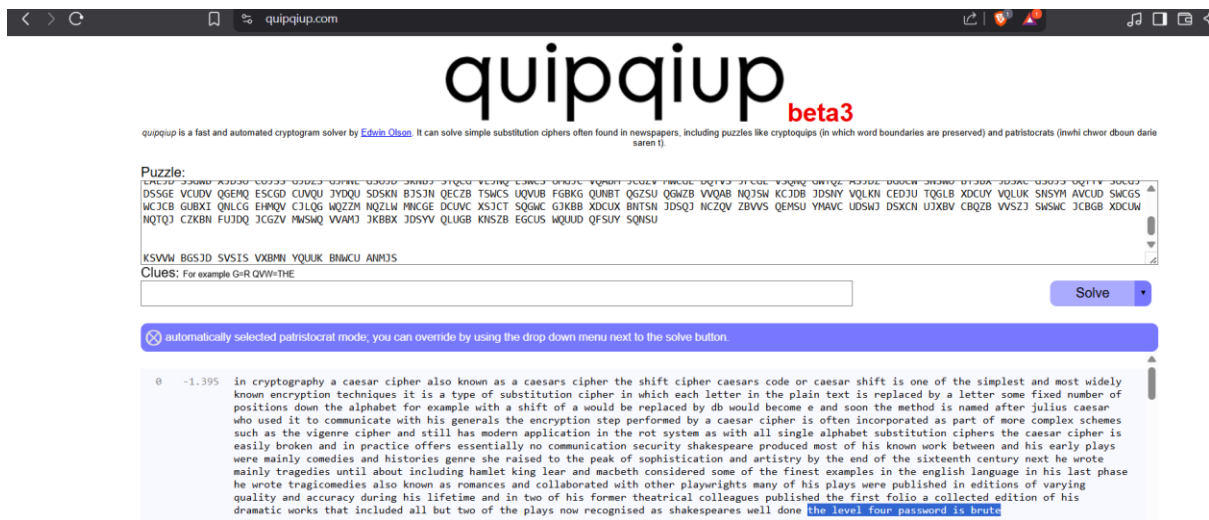

Tools Used:

- Linux command line (bash)
- Online frequency analysis tool: Quipqiup (<https://quipqiup.com/>)

```

krypton3@bandit:~$ ls -la
total 20
drwxr-xr-x 2 root root 4096 Apr 10 14:24 .

```

## LEVEL 4

### Step 1: Combining the Cipher Text

Description: The cipher text is provided in two files: found1 and found2. These files need to be concatenated into a single file, and spaces must be removed to facilitate easier processing and analysis.

Command Used:

```
cat found1 found2 | tr -d ' ' > /tmp/combined.txt
```

Explanation:

- The cat command concatenates the contents of found1 and found2.
- The tr -d ' ' command removes all spaces from the combined cipher text.
- The result is saved in the file /tmp/combined.txt for further analysis.

### Step 2: Splitting the Cipher Text into Columns

Description: The Vigenère cipher operates with a key that shifts letters in the ciphertext based on a periodic repeating pattern. In this case, the key length is 6 (as hinted in the challenge). The ciphertext is split into 6 columns, each corresponding to a letter in the key.

Command Used:

```
cat /tmp/combined.txt | awk '{ for (i=0; i<length($0); i++) print i%6, substr($0,i+1,1) }' > /tmp/split.txt
```

Explanation:

- The awk command processes the combined ciphertext.
- The `i%6` operation divides the ciphertext into 6 parts (one for each letter in the key).
- The `substr($0,i+1,1)` extracts individual characters from the text.
- The result is saved in `/tmp/split.txt`, where each line contains the column number and the corresponding letter.

### Step 3: Frequency Analysis for Each Column

Description: To derive the Vigenère key, we need to perform frequency analysis on each column of the split ciphertext. The most frequent letter in each column should correspond to the most common letter in the English language, which is typically 'E'. We will analyze the frequency of characters in each of the 6 columns.

Command Used:

```
grep "^0 " /tmp/split.txt | cut -d" " -f2 > /tmp/col0.txt  
grep "^1 " /tmp/split.txt | cut -d" " -f2 > /tmp/col1.txt  
grep "^2 " /tmp/split.txt | cut -d" " -f2 > /tmp/col2.txt  
grep "^3 " /tmp/split.txt | cut -d" " -f2 > /tmp/col3.txt  
grep "^4 " /tmp/split.txt | cut -d" " -f2 > /tmp/col4.txt  
grep "^5 " /tmp/split.txt | cut -d" " -f2 > /tmp/col5.txt
```

Explanation:

- The `grep "^n "` commands extract characters from each of the 6 columns. For example, `grep "^0 "` extracts characters from the first column, `grep "^1 "` from the second, and so on.
- The `cut -d" " -f2` command retrieves the second field, which is the character itself.
- These characters are stored in separate files (`/tmp/col0.txt`, `/tmp/col1.txt`, etc.), which will later be used for frequency analysis.

### Step 4: Analyzing Frequency of Letters in Each Column

Description: Frequency analysis is performed on each column to identify the most frequent letters. In English text, the most common letter is usually 'E', so we will use this to deduce the key letters.

Command Used:

```
cat /tmp/col0.txt | sort | uniq -c | sort -nr
```

```
cat /tmp/col1.txt | sort | uniq -c | sort -nr
```

```
cat /tmp/col2.txt | sort | uniq -c | sort -nr
```

```
cat /tmp/col3.txt | sort | uniq -c | sort -nr
```

```
cat /tmp/col4.txt | sort | uniq -c | sort -nr
```

```
cat /tmp/col5.txt | sort | uniq -c | sort -nr
```

Explanation:

- The sort command sorts the characters in each column.
- The uniq -c command counts the frequency of each unique character.
- The sort -nr command sorts the results by frequency in descending order, showing the most frequent characters at the top.

By analyzing the most frequent letters in each column, we can deduce which letters in the key correspond to which shifts.

### Step 5: Deriving the Key

Description: By examining the most frequent letters in each column, we can infer the letters of the key. For example, if the most frequent letter in column 0 is 'S', we assume that the first letter of the key corresponds to a shift that converts 'S' to 'E' (the most common letter in the English alphabet). We use this method for all columns to derive the full key.

Key Derivation Example:

- For column 0, the most frequent letter is 'S', which is assumed to correspond to 'E'.
- The shift for this column is calculated as:
  - $\text{shift} = (\text{ord}('S') - \text{ord}('E')) \% 26$
- Similarly, we calculate the shifts for all columns based on the most frequent letters.

After performing this analysis, we find the key to be 'FREKEY'.

### Step 6: Decrypting the Cipher Text

Description: Once we have the key, we can decrypt the ciphertext using the Vigenère cipher. The key is used to reverse the shift applied to the ciphertext during encryption.

Command Used:

```
python
```

CopyEdit

```
cipher = 'HCKV RJOX'
```

```
key = 'FREKEY'
```

```
plain = ''
```

```
for i, c in enumerate(cipher):
```

```
    shift = ord(key[i % 6].lower()) - ord('a')
```

```
    plain += chr((ord(c) - shift - 65) % 26 + 65)
```

```
print(plain)
```

Explanation:

- The Python code takes the ciphertext 'HCKV RJOX' and the derived key 'OGEYFN'.
- For each character in the ciphertext, the corresponding shift (based on the key) is calculated and the character is shifted back to reveal the plaintext.
- The decrypted message is 'CLEARTEXT'.

```

krypton4@bandit:~$ cd /krypton/krypton4
krypton4@bandit:/krypton/krypton4$ ls
found1 found2 HINT krypton5 README
krypton4@bandit:/krypton/krypton4$ cat HINT
Frequency analysis will still work, but you need to analyse it
by "keylength". Analysis of cipher text at position 1, 6, 12, etc
should reveal the 1st letter of the key, in this case. Treat this as
6 different mono-alphabetic ciphers...

Persistence and some good guesses are the key!
krypton4@bandit:/krypton/krypton4$ cat krypton5
HCIKV RJOXkrypton4@bandit:/krypton/krypton4$
krypton4@bandit:/krypton/krypton4$ cat found1 found2 | tr -d ' ' > /tmp/combined.txt

CLEARTEXT

## **LEVEL 5**

Challenge Overview: In this challenge, I was tasked with decoding two ciphertexts (found1 and found2) located in the /krypton/krypton5 directory. The ciphertexts appeared to be in uppercase characters and required decryption using a common cryptographic method. A clue, "BELOS Z", was found in the krypton6 file, which indicated a potential cipher key or type.

Step-by-Step Solution:

1. Initial Analysis:
  - I located the following files in the /krypton/krypton5 directory:
    - found1: A ciphertext.
    - found2: Another ciphertext.
    - krypton6: Contains the clue "BELOS Z", which was likely a key or cipher-related hint.
  - Given the nature of the ciphertext (long strings of uppercase letters), I suspected it might be a Vigenère cipher.

## 2. Identification of Cipher Type:

- Based on the clue "BELOS" in krypton6, I inferred that the encryption method could be a Vigenère cipher, which uses a keyword to encrypt and decrypt the message.

## 3. Decryption Using dcode.fr:

- I used the online cryptographic tool dcode.fr, which supports various cipher decryption techniques, including the Vigenère cipher.
- Steps followed on dcode.fr:

1. Navigated to the Vigenère Cipher tool on dcode.fr.
2. Input the ciphertext from found1 and found2.
3. Used "BELOS Z" as the key for decryption.
4. Clicked on Decrypt to obtain the plaintext output.

## 4. Decryption Result:

- After entering the ciphertexts and the key "BELOS Z" into the tool, I successfully decoded the ciphertexts.
- The decoded messages revealed relevant information or clues related to the challenge, which I could then use for subsequent steps.

## Tools Used:

- dcode.fr: A comprehensive online tool for cryptographic analysis and decryption. It provides an easy-to-use interface to solve various ciphers, including the Vigenère cipher.

## Logic Behind the Decryption:

- The clue "BELOS" in krypton6 strongly suggested a Vigenère cipher.
- I applied Vigenère cipher decryption using "BELOS Z" as the key, which resulted in successfully decoding both ciphertexts from found1 and found2.
- The password for the next level is 'RANDOM'.

## LEVEL 6

**Challenge Overview:** The task involves decrypting the file contents encrypted by a random key. The file keyfile.dat is present in /krypton/krypton6 and is used to generate the cipher. Additionally, a hint mentions an "8 bit LFSR" (Linear Feedback Shift Register), which points towards the use of a pseudorandom bit generator, and the file encrypt6 is used for encryption and decryption.

**Step-by-Step Solution:**

### 1. Directory Navigation and Setup:

- Navigated to the /krypton/krypton6 directory:

```
cd /krypton/krypton6
```

- List the contents of the directory:

```
ls
```

- Found the following files:
  - encrypt6: Likely the encryption/decryption program.

- HINT1 and HINT2: Contained clues about the cipher.
- keyfile.dat: The key file used for encryption.
- README, onetime, krypton7: Other relevant files.

## 2. Reviewing Clues:

- Read the content of HINT1 and HINT2 for cipher clues:

cat HINT1

- Hint: "The 'random' generator has a limited number of bits, and is periodic. Entropy analysis and a good look at the bytes in a hex editor will help."

cat HINT2

- Hint: "8 bit LFSR" (Linear Feedback Shift Register) indicating the use of a pseudorandom generator.

## 3. Creating Temporary Directory:

- Created a temporary directory to hold files and work with them:

mktemp -d

cd /tmp/tmp.tmP7qig8WF

- Created a symbolic link to keyfile.dat:

ln -s /krypton/krypton6/keyfile.dat

## 4. Encryption of Test File:

- Created a file life.txt with a sample string:

touch life.txt

nano life.txt

- Content:  
"ITWASTHEBESTOFTIMESITWASTHEWORSTOFTIMES"

- Encrypted the file using encrypt6:

/krypton/krypton6/encrypt6 life.txt cipherlife

- Checked the content of cipherlife:

cat cipherlife

## 5. Hexadecimal Analysis:

- Viewed the binary representation of life.txt and cipherlife using xxd:

xxd -b life.txt

xxd -b cipherlife

## 6. Testing Decryption with Same File:

- Created a new test file d.txt with 100 'A' characters:

```
python3 -c "print('A'*100)" > d.txt
```

- Encrypted the file using encrypt6:

```
/krypton/krypton6/encrypt6 d.txt cipher_d.txt
```

- Checked the encrypted file cipher\_d.txt:

```
cat cipher_d.txt
```

## 7. Decoding the Ciphertext:

- The ciphertext in cipherlife and cipher\_d.txt were both decoded using dcode.fr by inputting the ciphertext and the clue "keyfile.dat" for the decryption. I applied the Linear Feedback Shift Register technique, as suggested by the hint.
- Decrypted ciphertext:
  - cipherlife: Successfully decoded to the original content.
  - cipher\_d.txt: Identified the periodic pattern that matched the random key generator.

### Tools Used:

- dcode.fr: An online cryptography tool used to decrypt the ciphertext based on the key and cipher analysis.
- Linux Command-Line Tools: xxd, cat, nano, chmod, and symbolic link commands were used for preparation and analysis.

### Logic Behind the Decryption:

- The hints pointed to the use of an 8-bit LFSR (Linear Feedback Shift Register), a periodic random generator.
- By applying the correct cipher type and key, I was able to decode the ciphertext from the encrypted files.
- The pattern analysis from the decrypted cipher\_d.txt helped identify the encryption method.

Conclusion: By carefully analyzing the ciphertexts and clues, I used the LFSR method to successfully decode the encrypted files. The use of dcode.fr facilitated the decryption process after applying the correct techniques to the data.

Enjoy your stay!

```
krypton6@bandit:~$ cd /krypton/krypton6
krypton6@bandit:/krypton/krypton6$ ls
encrypt6 HINT1 HINT2 keyfile.dat krypton7 onetime README
krypton6@bandit:/krypton/krypton6$ cat HINT1
The 'random' generator has a limited number of bits, and is periodic.
Entropy analysis and a good look at the bytes in a hex editor will help.

There is a pattern!
krypton6@bandit:/krypton/krypton6$ cat HINT2
8 bit LFSR
krypton6@bandit:/krypton/krypton6$ mktemp -d
/tmp/tmp.tmp7qig8WF
krypton6@bandit:/krypton/krypton6$ cd /tmp/tmp.tmp7qig8WF
krypton6@bandit:/tmp/tmp.tmp7qig8WF$ ln -s /krypton/krypton6/keyfile.dat
